#### **DETAILED ACTION**

# Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 21 and 22 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claims 21 and 22 are not clear. Claim 22 recites that the "exercise rug has dimensions smaller than the dimensions of said exercise mat". The applicant has stated that the "other surface" is the surface of an "exercise mat" in claim 21. In claim 1 the "other surface" is claimed as one of the "at least two surfaces" of the woven rug. It is not clear to the examiner how the dimensions of the "woven rug" can be smaller than the dimensions of the "exercise mat" when the "exercise mat" is a part of the "woven rug" as stated in claim 1.

### Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-3, 5-13, 17-21 are rejected under 35 U.S.C. 102(b) as being anticipated by Patterson US patent 1,846,751.

Application/Control Number: 10/626,311

Art Unit: 3765

Patterson '751 discloses terry woven fabric goods such as "towels, bath mats, and wash cloths." The examiner considers a terry woven fabric, which can be used as a bath mat to also be inherently capable of functioning as a "woven exercise rug". The general definition of rug being "a piece of thick heavy fabric that usually has a nap or pile and is used as a floor covering (From Merriam-Webster dictionary)."

Looking to figures 1 and 2, the woven fabric shows a central portion 1 which is smooth, and an upper portion directly above central portion 1 and a lower portion directly below central portion 1. In both of these areas there are variations in the pile height at 6 (flat portions) and 2, 3, 4 (contoured portions). These variations would cause an increase of frictional (traction) properties of the contoured areas in relation to the central portion 1 of the fabric as recited in claim 1.

It is plainly shown in figure 1, that the area of the central portion 1 is greater than the area of the upper or lower contoured portions as recited in claim 3.

The contours of Patterson correspond to the "ridges" of claim 5 and are oriented perpendicularly as recited.

The contours of Patterson are spaced apart at regular intervals except for the spacing between areas 6, 4, and 5 respectively. Figure 2 shows that the width of 6 is larger than 5, as well as the width of 4 being larger than 3.

The limitations of claims 9 and 10 are inherent to any pile fabric as the surface effect of the fabric is caused by yarns that are "supplementary" and not integral to the ground fabric structure. This can be seen in figure 3 of Patterson, where reference

Application/Control Number: 10/626,311

Art Unit: 3765

numeral 4 shows the pile weft and the ground fabric structure (which is not given a reference numeral).

The contours of Patterson are "uniformly" spaced across the upper and lower portions of the terry fabric as recited in claims 17 and 18. These spacing does change for the contours as cited above but the change in spacing is used on the upper and lower portions and is therefore "uniformly" spaced, as the examiner is applying "uniformly" in the broadest reasonable terms.

The contours of Patterson are also considered to be "bumps" in the broadest reasonable terms, as recited in claim 19.

The terry fabric of Patterson is rectangular in shape as seen in figure 1, as recited by claim 20.

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claim 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over Patterson '751.

Although Patterson teaches essentially all of the limitations of the instant invention, Patterson does not explicitly show that the area of the central portion is larger than the combined area of the upper and lower contoured portions of the rug as recited in claim 4.

Application/Control Number: 10/626,311

Art Unit: 3765

However, with respect to the limitation, the specification contains no disclosure of either the critical nature of the claimed limitations or any unexpected results arising therefrom, and that as such the limitations were arbitrary and therefore obvious. Such unsupported limitations cannot be a basis for patentability, since where patentability is said to be based upon particular dimensions or another variable in the claim, the applicant must show that the chosen variables are critical. *In re Woodruff*, 919 F.2d 1575, 1578, 16 USPQ2d 1934 (Fed. Cir. 1990). One having ordinary skill in the art would be able to determine through routine experimentation the ideal area of the central portion versus the upper and lower contoured portions for a particular application.

Claims 14-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Patterson '751 in view of Kobe et al., US patent 6,372,323.

Although Patterson teaches essentially all of the limitations of the claimed invention, Patterson does not teach the contours being formed by the attachment of a separate layer of material, attached to the upper and lower portions.

The predetermined spacing arrangement was previously taught in Patterson as cited above.

Kobe '323 teaches a slip control article, which is composed of a plurality of backing layers and upstanding stems that give the frictional properties of the article. The backing layer, which can be formed of multiple sub-layers, is sufficiently thick to bond a reinforcing web during extrusion, such as a sheet of fabric (woven or non-woven), to impart increased tear resistance and tensile strength. The slip control article also includes primarily upstanding stems 26 which are integrally formed with at most

Application/Control Number: 10/626,311 Page 6

Art Unit: 3765

one of the many layers of the backing and then adhesively attached to the backing layers. The upstanding stems 26 are arranged in a regular or irregular array. Various patterns of stems may be used.

Therefore it would have been obvious to combine the teachings of Kobe with those of Patterson to attach a separate layer of upstanding stems (contours) to the fabric in a regular or irregular array of stems (contours) to provide a material with increased frictional properties.

#### Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Multiple references with contoured pile fabrics have been cited.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Robert H Muromoto, Jr. whose telephone number is 703-306-5503. The examiner can normally be reached on 8-530, M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, John Calvert can be reached on 703-305-1025. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
